

ABSTRACT

Polymer comprising water-soluble units and units with an LCST, and aqueous composition comprising it.

The present application relates to a polymer comprising water-soluble units and units having a temperature of LCST type consisting of N-vinylcaprolactam homopolymers or of derived copolymers.

The invention also relates to an aqueous composition, especially a thickened, or even gelled, transparent aqueous composition, comprising at least one such polymer and an aqueous phase, for example a cosmetic or dermatological composition.
